

# 02 Handling the User's Submitted Data

Monday, July 16, 2018 8:05 PM

## **004 - Intro to PHP - Handling Form Submission**

Ok, we have the login and register form on the same page - register.php

Time for an intro to PHP

PHP goes inside `<?php (code goes here) ?>` tags

He writes some PHP code that says if loginButton is pressed, echo some text which basically gets printed as body text in the page.

Then he c/p that code but changes it to be for the registerButton.

## **005 - Form Sanitation - Cleaning the Input**

How do we get the values that the user puts into the input forms? We use the 'name' attributes from the HTML `<input>` code.

## **006 - Separating Our Code**

## **007 - Preparing Our Validation Functions**

## **008 - Creating the Account Class**

## **009 - Validating the Username**

## **010 - Validating the Name and Emails**

## **011 - Validating the Passwords**

## **012 - Checking if the Signup was Successful**

## **013 - Outputting Error Messages**

## **014 - Creating our Constants Class**

## **015 - Remembering Form Values**
